

Day 9 Homework

Eric Dunford University of Maryland

1. Write a function to do a bunch of clean-up and formatting to your data.
2. Make sure this function works on your data.
3. Get some subset of your data, or find a similar-but-not-identical data set. Change up the column order. Re-run your function on this new data. Does it work?
4. Fix your function to be able to work on the new data.
5. Write a function to do some kind of summary stat, and use the dplyr functions to run this function over groups of your data.
